PRODUCT SHEET – LOAD MONITOR & OPTIMIZER

Do your data loads delays or errors prevent your timely reporting?

Most likely your data loads are running outside of office hours, and you may discover load errors or delay at the same time as your business users.

When the errors are discovered, it may take some time before the data is ready for reporting, in turn causing delays in business processes and replanning in the end users' activities.

Overall, unreadiness of data is perceived as the number one challenge of reporting solutions, either directly or indirectly (if detected as data errors).

Depending on your team set-up, it may be difficult to prevent these delays and request team members to work odd hours.

Approxima's solution

In collaboration with our offshore partners, we can offer a model where your data loads are monitored during the night / outside of office hours. Most often, action can be taken immediately, and the loads complete without any noticeable delay.

Additionally, you will receive an overview of any load challenge, so your team is prepared to communicate with the business users upfront.

Together we will review a list of prioritized suggestions for optimizations, in the design of the flow or in the scheduling, so that the same or frequent errors receive a permanent fix.

Depending on your set-up, we will also interact with the integration team or the team responsible for the data in the source system, if this is the origin of the load error.

Your Benefit and Business Value

Most errors are resolved during the night and your business users won't notice that there might have been a problem. In case the error could not be resolved, you will know beforehand, and you will be able to communicate upfront with your business users.

You should expect:

Fewer days impacted by nightly load errors
Plan for correction of recurring errors
Increased reliability of report data and improved user satisfaction and adoption
