

PRODUCT SHEET - BI & ANALYTICS VITALITY BOOST

Do your most used reports need a vitality boost?

Your reports may be out of sync with the process they are measuring, in terms of data, update times or the process itself.

Your users may not be experiencing the expected or perhaps even promised performance.

Your reports may be impacted by incremental development and quick fixes, which are starting to impact their sustainability and usability, as they begin to silt up.

Ultimately this may be resulting in a decreasing adoption and user satisfaction impacting your solution's rentability.

Approxima's solution

We will look at your most critical reports, analyze their usage, their design and development over time.

If they display a visualization, we verify that it provides the most impactful effect for the desired outcome.

We will listen to report users to understand their usage patterns and reporting experience.

From there, we deep-dive in the data flow and architecture in the backend and look for possible improvements and fine-tuning.

We also verify that the data foundation and load frequency correspond to the expected outcome as well as to the transaction data and process in the source system. It may have changed over time and have brought the reporting solution out of sync

Your Benefit and Business Value

The output is a list of prioritized and estimated recommendations and tasks. Normally no further analysis will be needed, and you will benefit from a swift and smooth way to bring your reports back on track.

You should expect:

Faster response time and timely data availability
Improved, validated data quality and synchronized business process
Improved user adoption and satisfaction
